PCVS-1, -2
CONTROL VALVE SUPERVISORY SWITCH

UL, ULC, and CSFM Listed, FM Approved, NYMEA Accepted, CE Marked

Dimensions: 4.75"L x 2.25"W x 8.2"H (stem extended)
12.1cm L x 5.7cm W x 18.3cm H

Weight: 1.35 lb. (0.61 kg.)

Enclosure: Cover - Die-cast
Finish - Red Spatter Enamel
Base - Die Cast Zinc
All parts have corrosion resistant finishes.

Cover Tamper: Tamper Resistant Screws,
Optional cover tamper switch kit available

Mounting: 1/2" NPT

Contact Rating:
PCVS-1: One set of SPDT (Form C)
PCVS-2: Two sets of SPDT (Form C)
15 Amps at 125/250VAC
2.5 Amps at 30VDC resistive

Environmental Limitations:
-40°F to +140°F (-40°C to 60°C)
NEMA 4 and NEMA 6P Enclosure (IP67) when used with appropriate watertight conduit fittings.
Indoor or Outdoor Use (Not for use in hazardous locations. See bulletin no. 5400694 PIVS-U-EX for hazardous locations.)

Conduit Entrances: Two knockouts for 1/2" conduit provided.

Service Use:
- Automatic Sprinkler
- One or two family dwelling
- Residential occupancy up to four stories
- National Fire Alarm Code

The Model PCVS is a weather proof and tamper resistant switch for monitoring the open position of fire sprinkler control valves of the post indicator, butterfly and other types. Depending on the model, one or two SPDT (Form C) contacts are provided which will operate when the valve position is altered from an open state.

The unit mounts in a 1/2" NPT tapped hole in the post indicator or butterfly valve housing. The device is engaged by the indicating assembly of the post indicator or the operating mechanism of the butterfly valve, actuating switch(es) when the valve is fully open. The unit should be installed where it is accessible for service.

The cover is held in place by two tamper resistant screws that require a special tool to remove. The tool is furnished with each device and should be left with the building owner or responsible party. Replacement or additional cover screws and hex keys are available. See ordering information.

Optional Cover Tamper Switch
A field installable cover tamper switch is available as an option which may be used to indicate removal of the cover. See ordering information.

Testing
The PCVS and its associated protective monitoring system should be tested in accordance with applicable NFPA codes and standards and/or the authority having jurisdiction (manufacturer recommends quarterly or more frequently).

For pressure reducer type valve installation kits (if required) contact valve manufacturer.
9. Insert a scale or probe thru the nipple to measure the distance from the
open end of the nipple to the target assembly. Subtract 1/2" (12.5mm)
from this measurement.

10. Using the special tool provided, loosen the two cover screws and remove
the cover from the PCVS.

11. Loosen the locking screw that holds the trip rod in place and adjust the
rod length, from the end of the collar to the end of the rod, using the
dimension determined in Step 9. Tighten the locking screw to hold the
rod in place.

NOTE: If trip rod length is excessive, loosen the locking screw and
remove the trip rod from the trip lever. Using pliers, break off the one
(1) inch long notched section (see Fig. 7). Reinstall trip rod and repeat
Step 11 procedure.

12. Partially close the valve (3 to 4 revolutions of the handle/hand wheel).

13. Slide the PCVS unit as far as possible onto the nipple, observing which
direction the rod will move when the valve is closed. Orient the device
to actuate the switches when the valve is open. Tighten the socket head
screw in the collar.

14. Carefully open the valve to the fully open position. As the target moves to
the open position it should engage the trip rod and actuate the switch(es).
There should be a minimum overtravel of 1/2 revolution of the handle/
hand wheel after the switch(es) actuate (a continuity meter connected
to each set of contacts is one method that could be used to determine
this).

15. Slowly close the valve. The switch must operate during the
first two revolutions of the handle/hand wheel.

16. Using the special tool provided, loosen the two cover screws and remove
the cover from the PCVS.

17. Partially close the valve (3 to 4 revolutions of the handle/hand wheel).

18. Carefully open the valve to the fully open position. As the target moves to
the open position it should engage the trip rod and actuate the switch(es).
There should be a minimum overtravel of 1/2 revolution of the handle/
hand wheel after the switch(es) actuate (a continuity meter connected
to each set of contacts is one method that could be used to determine
this).

19. Slowly close the valve. The switch must operate during the
first two revolutions of the handle/hand wheel.

20. Using the special tool provided, loosen the two cover screws and remove
the cover from the PCVS.
Notes:

1. Subject to the approval of the “authority having jurisdiction” the alternate method of installation shown in Fig. 5 may be used. In this method, one of the glass windows of the housing is replaced with a 1/4” thick metal plate that is cut to fit in place of the glass and drilled and tapped to receive the 1/2" NPT pipe nipple. In some cases it may be necessary to attach an angle bracket to the target assembly to engage the PCVS trip rod.

2. If the target is stationary and a hood arrangement is used, such as is shown in Fig. 6, the hood must be drilled with a 23/32” drill and tapped with a 1/2” NPT. The center line of this hole should be 1/8” below the portion of target assembly that strikes the PCVS trip rod. The 11 3/8” dimension shown is for a Clow Valve. Flexible conduit must be used for this type of installation.

Typical Installation On A Butterfly Valve (See Figs. 9 And 10)

Refer to Fig. 2 for location of parts described in the following instructions:

B1. Remove the 1/2” NPT plug from the gear operator case.
B2. Loosen the set screw that holds the nipple in the PCVS and remove the nipple.
B3. Screw the locknut that is provided onto the nipple.
B4. Screw the nipple into the 1/2” NPT hole in the gear operator - hand tighten.
B5. Partially close the valve (3 or 4 revolutions of the hand wheel or crank).
B6. Using the special tool provided, loosen the two cover screws and remove the cover from the PCVS.
B7. Loosen the locking screw that holds the trip rod in place. Estimate trip rod length required and extend slightly past that point. Slide the PCVS unit as far as possible onto the nipple, observing which direction the rod will move when the valve is closed. Orient the device to actuate switches when valve is open.
Note: If trip rod length is excessive, loosen the locking screw and remove the trip rod from the trip lever. Using pliers, break off the one (1) inch long notched section (see Fig. 7). Reinstall trip rod and repeat Step B7 procedure.
B8. Remove device from nipple and withdraw trip rod 1/32” (0.80mm) (this dimension is important). Tighten the locking screw to hold the rod in place. Re-install the device on the nipple. Tighten the screw in the collar against the nipple.
Note: In some cases it may be necessary to remove the gear box cover to ensure correct operation (consultation with the valve manufacturer is recommended).
B9. Carefully open the valve to its full open position, as the boss on the gear hub moves to the open position it must engage the PCVS trip rod and actuate the switch(es). There should be a minimum overtravel or revolution of the crank or hand wheel after the switch(es) actuate (a continuity meter connected to each set of contacts is one method that could be used to determine this).
Note: Slight adjustment of gear stops may be necessary to prevent overtravel of the trip rod (consultation with valve manufacturer is recommended).
B10. Carefully close the valve. The switch(es) must operate during the first two revolutions of the crank or hand wheel or during 1/5 of the travel distance of the valve control apparatus from its normal condition.
B11. Complete the required electrical wiring, connections and tests. The valve should be operated through the entire cycle of fully closed and fully open to determine the integrity of the PCVS installation and signaling system.
Check that all electrical and mechanical connections are secure.
B12. When the installation and testing are complete, return valve to its proper position.
