This manual provides information on how to handle the fire extinguishing system VSH200 (hereinafter referred as the "system") in a safe and efficient manner. This manual is an integral part of the system and must be kept in its immediate vicinity at all times. It is intended for the owner of the system Chapter 2.6.1 “Qualifications” on page 19.

Before commencing any work, the personnel must have carefully read and understood this manual. It is essential for the safe operation of the system that all safety information and operating instructions provided in this manual be observed. In addition to the information provided in this manual, all local accident prevention and general safety regulations applicable at the system’s location must be observed. All images contained in this manual are intended to provide a general understanding and may vary from the model of the system you purchased.

This operating manual does not contain extensive information about installation, service and project planning. An installation and maintenance manual can be ordered from the manufacturer (page 2) with the part number 932167. For the project planning of VSH200 fire extinguishing systems, a design manual can be ordered from the manufacturer with the part number 932165.

The operation of the DesignManager software is described in a separate document (part number 924240).

Limitations of liability

All specifications and information provided in this manual have been compiled in consideration of all applicable standards and regulations as well as the state of the art. The manufacturer shall not be liable for any damages caused by:

- Failure to follow the instructions provided in this manual
- Disregarding local, federal, and state provisions and any regulations regarding the installation, operation and maintenance of fire extinguishing systems
- Operating the system in environmental and usage conditions other than the ones for which the system has been designed
- Improper use
- Use of untrained personnel
Technical modifications not authorized by the manufacturer
Use of unapproved components
Non-compliance with maintenance intervals

Fire extinguishing systems are engineered to meet the standards of NFPA 2001, ISO 14520, EN 15004, FM Global, UL, CEA 4045 or other similar organizations, and will also need to comply with the provisions of governmental codes, ordinances, and standards where applicable. The system must be designed by qualified design professionals in conjunction with insuring bodies. The Authorized Distributor and the user are responsible for the design and configuration of the system, its appropriateness for the use intended and its compliance with all standards, codes, ordinances and the use intended. The manufacturer or private labeler of the products, described in this manual, does not design systems for specific installations and makes no representation or warranty concerning whether any specific system installation will be sufficient for the intended use or will comply with any standard, code or ordinance.

System depictions, calculations, graphs or reports provided by the manufacturer or private labeler of the products, described in this manual, are for illustrative purposes only, and are not warranted to be representative or descriptive of any specific system, installation or design, or of the performance of or results attainable through same. The manufacturer or private labeler and its representatives disclaim use of the accompanying system depictions, calculations, graphs and reports for any purpose other than illustration; any other application or usage is solely the responsibility of the user.

Customer service
Our customer service department will be happy to assist you with any technical question you may have regarding the system. For contact information and additional details, please log on to our website (page 2). The members of our staff are, furthermore, always interested in obtaining information and learning about the experiences our customers have made while using our products as these may contribute to their improvement.

18.1 Non UL or FM Approved items

Please note, that some of the mentioned parts or systems in this manual are not UL\textsuperscript{1} listed or not FM\textsuperscript{2} Approved.

These parts or systems are distinguished with

- an asterisk combined with "not UL", for those parts or systems not UL listed, example: Component* not UL.
- an asterisk combined with "not FM", for those parts or systems not FM Approved, example: Component* not FM.

You will find the distinguished marks either at the headlines or in the product data sheets.

\textsuperscript{1) Underwriters Laboratories}

\textsuperscript{2) FM Approvals}

18.2 Abstract

The system works with HFC-227ea (hereinafter referred to as "extinguishing agent") as its extinguishing agent.

HFC-227ea is marketed by several manufacturers under different trade names:

- FM-200\textsuperscript{TM} by Chemours\textsuperscript{TM}
- MH227\textsuperscript{®} by Shanghai Waysmos
- Solkaflam\textsuperscript{®} 227 by Solvay

This extinguishing agent is suitable for suppressing class A and class B fires and stored in the system's extinguishing agent containers. To create the pressure necessary for the agent to be released, the extinguishing agent containers are superpressurized with nitrogen at a pressure of 25 bar (360 psi), 42 bar (610 psi) or 50 bar (725 psi).

The system is activated by release devices located on the valves of the extinguishing agent containers or integrated in the valves. The valves open, and the extinguishing agent flows through the pipelines of the extinguishing agent containers to the discharge nozzles, where it vaporizes.

\textit{HFC-227ea (heptafluoropropane) is a fluorinated greenhouse gas with a CO$_2$ equivalent (GWP) of 3220.}
Overview

For more detailed brief descriptions of the different system models, please refer to the description of the system "Chapter 3 “Design and function” on page 29.

Use the system only as intended in order to ensure its proper and trouble-free operation "Chapter 2.2 “Intended use” on page 12."
2 Safety

This section provides an overview of all important aspects that are essential for the protection of personnel as well as safe and trouble-free operation. Additional task-specific safety instructions will be provided in the sections that refer to the individual life stages of the plant.

2.1 Explanation of symbols

Safety instructions

Safety instructions are marked with symbols in these instructions. The safety instructions are always introduced by signal words that express the extent of the danger.

⚠️ DANGER

This combination of symbol and signal word indicates a hazardous situation which, if not avoided, will result in death or serious injury.

⚠️ WARNING

This combination of symbol and signal word indicates a hazardous situation which, if not avoided, could result in death or serious injury.

⚠️ CAUTION

This combination of symbol and signal word indicates a hazardous situation which, if not avoided, may result in minor or moderate injury.

⚠️ NOTICE

This combination of symbol and signal word indicates a hazardous situation which, if not avoided, may result in property damage.

Tips and recommendations

This symbol indicates useful tips and recommendations as well as information for efficient and trouble-free operation.
2.2 Intended use

This system is intended to be used only for the proper purpose described herein.

The VSH200 fire extinguishing system is intended only for suppressing fires in enclosed rooms using HFC-227ea extinguishing agent.

Typical fire hazards for which the system is suitable include:

- Electric or electronic equipment
- Telecommunications equipment
- Flammable and combustible liquids
- Other goods of particularly high quality

The system may only be used in the environmental and usage conditions for which it has been designed.

Intended use also includes the adherence to all specifications regarding assembly, installation, maintenance, and inspection.

Incorrect use

Any other use exceeding or deviating from the scope of intended use is considered incorrect use.
Risk from incorrect use!

- Do not perform any structural modifications on the protected enclosure or the system.
- Do not use the protected enclosure for any purpose other than the one designed by the Authorized Distributor.
- Do not block the discharge nozzles or the ventilation equipment.

If used incorrectly, the VSH200 fire extinguishing system may lead to personal injury and property damage.

Do NOT use the system in conjunction with the following fire hazards:

- Chemicals that release oxygen
- Mixtures containing oxidizing substances (e.g., sodium chlorate, sodium nitrate, explosives, gunpowder)
- Chemicals capable of thermally decomposing autonomously (e.g., certain organic peroxides)
- Reactive metals (e.g., sodium, potassium, magnesium, titanium or zirconium) and reactive hybrids or metal amides
- The effects of agent decomposition on fire protection effectiveness and equipment shall be considered where using clean agents in hazards with high ambient temperatures (e.g., furnaces and ovens)

In some countries and regions the use of fluorinated greenhouse gases for extinguishing purposes is prohibited and subject to specific requirements.

2.3 System-specific design specifications

The system is composed of several approved components. Please consult the Authorized Distributor when planning structural modifications to the system/the protected enclosure or any other kinds of use.

Never perform any structural modifications or use the protected enclosure for other purposes.
2.4 General dangers

The following section describes remaining risks that can arise from the system even with proper use.

In order to reduce risks of personal injury and property damage and avoid dangerous situations, the safety instructions listed here and the safety instructions in the other sections of these instructions must be followed.

2.4.1 General dangers associated with fire extinguishing systems

Electrical current

Risk of death due to electric shock!

- Allow only qualified electricians to work on electrical components and the electrical connection.
- Shut down the power supply immediately and consult the Authorized Distributor in the event of damage to the wire insulation.
- Keep moisture away from live components. This may lead to short circuits.

An imminent, risk of death due to electric shock exists if live components are touched. Damage to the wire insulation of individual components involves the risk of fatal injury.

High extinguishing agent concentration

There is a life-threatening danger if the extinguishing agent concentration is too high!

- When handling extinguishing agent, always ensure sufficient ventilation or extraction. If this cannot be ensured, use a self-contained breathing apparatus.
- Avoid inhaling vapors, aerosols, and atomized spray that exceed the recommended exposure limits per NFPA 2001.

If the extinguishing agent concentration exceeds 9 % by vol. (NOAEL), the extinguishing agent can have a toxic effect. There is a danger of harming the heart and lungs, and danger of suffocating due to the reduced oxygen content in the air.
Decomposition products

**WARNING** Risk of injury from developing products of decomposition and fire smoke!

- Leave the extinguishing zone without delay and within the pre-discharge timer when an alarm is given.
- Do not re-enter the extinguishing zone after a fire until the fire department has given the all-clear.

Fires generate products of decomposition which may lead to chronic damage to a person's health if inhaled or coming into contact with the skin.

Pressurized extinguishing agent

**WARNING** Danger of injury due to pressure in extinguishing agent containers!

- Do not transport or store extinguishing agent containers unless they are sealed with a protective valve cap and an anti-recoil cap.
- Make sure the extinguishing agent container is adequately braced utilizing clamps.
- Have damaged extinguishing agent containers replaced immediately by the Authorized Distributor.

If pressurized extinguishing agent containers are damaged and extinguishing agent escapes uncontrollably, there is a risk of death.

Tipping extinguishing agent containers

**WARNING** Danger of injury due to tipping extinguishing agent containers!

- Allow only the Authorized Distributor or service personnel authorized by the Authorized Distributor to transport extinguishing agent containers.

Extinguishing agent containers are heavy and may have a high center of gravity depending on the design. If extinguishing agent containers tip while being handled, this can lead to severe injuries.
2.4.2 Dangers when the system is activated

Cold extinguishing agent

⚠️ WARNING
Risk of injury from cold extinguishing agent!
- Leave the extinguishing zone without delay and within the pre-discharge timer when an alarm is given.
- Stay out of the direct flow area of a discharge nozzle.

The extinguishing agent exiting at the discharge nozzles is very cold. Direct contact may result in injury.

Shock

⚠️ WARNING
Risk of injury from shock!
- Inform all persons staying inside or close to the protected enclosure about the existence of an automatic fire suppression system and the possibility of the system's activation.
- Make persons familiar with the procedures required in the event of an alarm, a fire or the activation of the fire suppression system.
- If in doubt, deny persons direct access to the protected enclosure.

The activation of the system involves noises from the discharged agent which may surprise persons to an extent that they suffer shock.

Faulty activation

⚠️ WARNING
Risk of injury from faulty activation!
- Activate the system only in the event of a fire.
- Protect the manual release devices in the protected enclosure from inadvertent activation.
- Refrain from smoking inside the protected enclosure.
- Before performing any work generating heat and smoke, observe the following:
  - Isolate the system.
  - Switch off the fire alarm system.

A faulty activation of the system may cause severe injuries and property damage.
Falling and flying objects

Risk of injury from falling and flying objects!
– Do not place any loose objects into the discharge area of the discharge nozzles.
– Leave the extinguishing zone without delay and within the pre-discharge timer when an alarm is given.

The discharge velocity of the extinguishing agent may cause objects to tip over or become airborne. This may lead to severe injuries.

Noise

Risk of injury from noise!
– Leave the extinguishing zone without delay and within the pre-discharge timer when an alarm is given.
– Stay out from the immediate vicinity of acoustic alarm equipment and discharge nozzles.

High sound pressure levels caused by discharged gas and acoustic alarm equipment (e.g. signal horns) may cause hearing damage.

Effects of cold

Property damage from cooling ambient air!
– Do not attach/store components that are sensitive to cold in the immediate vicinity of the discharge nozzles.

The discharged extinguishing agent extracts heat from the ambient air contained in the extinguishing zone in order to put out the flames. This cools down the extinguishing zone by as much as 20 °C (36 °F) when fighting a fire.
Safety

Overpressure/underpressure

**NOTICE**

Property damage from overpressure/underpressure!

- Ensure that pressure relief devices are installed in the protected enclosure and included in the design of the system, per NFPA 2001.
- Make sure that the function of the pressure relief is checked regularly.

Immediately after activated, the system briefly generates an underpressure which will then turn into an overpressure. This may cause damage to the walls of the protected enclosure.

2.5 Behavior in the event of a fire

Preventive steps

- Be prepared for fires and accidents at all times!
- Keep first-aid equipment (first-aid kit, blankets, etc.) and substitute extinguishing agents (e.g. fire extinguisher) in proper working order and readily available.
- Familiarize personnel with accident prevention, first aid and rescue equipment as well as options for activating the system manually.
- Keep access paths clear for rescue vehicles.

Steps in the event of a fire

**WARNING**

Danger to life from fire!

- Leave the extinguishing zone immediately if it is affected by fire.
- Do not re-enter the extinguishing zone after a fire until the fire department has given the all-clear.

Severe fire smoke may develop when a fire erupts and while the fire is being suppressed. Staying inside a burning extinguishing zone may lead to severe injuries or death.

When the alarm equipment of the system is activated (main alarm), a pre-discharge timer (generally 10 s) will start to elapse. The system will subsequently be activated when the pre-discharge timer has elapsed.
Take the following steps when a fire erupts:

- If there is no risk to a person's health, activate the system manually when it is obvious that smoke/fire has developed.
- Provided there is no risk to your own health, evacuate all persons from the hazard zone.
- Leave the extinguishing zone immediately.
- Initiate first-aid measures if necessary.
- Alert any endangered persons in the adjoining areas.
- Notify the fire department and/or emergency medical services.
- Notify the person in charge at the system's location.

**After the system is activated**

The behavior after the activation of the system is subject to specific rules of conduct, which will be explained in a separate section.

### 2.6 Personnel requirements

#### 2.6.1 Qualifications

The different tasks described throughout this manual require different qualifications and skills from the persons entrusted with these tasks.

**WARNING**

Risk from insufficiently qualified personnel!
- Allow only qualified personnel to perform the work.

Insufficiently qualified personnel is incapable of assessing the risk involved in handling the system and may cause severe or fatal injuries to themselves or others.

All work must be limited to personnel that can be expected to complete the work in a reliable manner. Persons whose ability to respond is impaired, for example, by drugs, alcohol or medication are not permitted.
The following is a list of qualifications this manual specifies as necessary for the persons entrusted with completing the different work tasks:

**Authorized Distributor**
The Authorized Distributor has verifiably undergone training provided by the manufacturer during which the company was made familiar with the knowledge and procedures necessary to install, commission and service fire suppression systems in a safe manner.

**Person in charge of the system**
The person in charge of the system has verifiably been given instructions by the company that installed the system as to the specifics of the tasks entrusted to him/her and all possible dangers that may arise from improper conduct.

The person in charge of the system has been appointed by the owner as the person who is responsible for the correct and proper completion of the work and inspections performed on the system.

**Qualified electrician**
The qualified electrician is capable of performing work on electrical systems and independently detecting and avoiding any possible risks due to his/her long years of expertise and experience and his/her familiarity with all applicable standards and regulations.

A qualified electrician must also provide proof of his/her professional qualification that confirms his/her capacity to perform work on electrical systems.

The qualified electrician must comply with the provisions of all applicable legal regulations regarding accident prevention.
2.6.2 Unauthorized personnel

**WARNING**

Risk of injury from unauthorized personnel!
- Keep unauthorized personnel away from controlling and regulating equipment.
- If in doubt, ask the respective persons to step away from the controlling and regulating equipment.
- Make sure that a person in charge of the system is available who has the knowledge necessary to handle the system properly.

Unauthorized personnel who do not meet the requirements described herein are not familiar with the risks involved in activating and/or isolating the system. This will lead to risk of injury.

2.7 Personal protective equipment

Personal protective equipment serves to protect risks to the safety and health of persons during work.

During the various work on and with the system, the personnel must wear the protective equipment that is referred to specially in the individual sections of these instructions.

**Description of the personal protective equipment**

The personal protective equipment is explained below:

**Extinguishing-agent-resistant safety gloves**
Extinguishing-agent-resistant safety gloves protect the hands from contact with extinguishing agent.

**Protective goggles**
Protective goggles cover the entire area of the eyes (including the sides) and are used to protect the eyes from the extinguishing agent and from particles that are whirled up by the extinguishing agent.

**Safety footwear**
Safety footwear protects the feet from crushing injuries, falling parts, and slipping on slippery substrates.
Safety

Safety gloves
Safety gloves are used to protect the hands from friction, abrasions, puncture wounds or deeper wounds as well as coming into contact with hot surfaces.

2.8 Signage

The following symbols and information signs have been attached in the area of the system.

**WARNING**

Risk from illegible or missing signs!

– Keep all safety, warning and operating instructions easily legible at all times.

– Immediately replace damaged signs or stickers.

Over time, stickers and signs can become dirty or illegible for other reasons, so that risks can no longer be recognized and necessary operating instructions can no longer be adhered to. This will lead to risk of injury.

System labeling

In addition to the information on the type plate attached to the extinguishing agent container, the system should be labeled with the following information.

Fig. 2 shows an example of a label. The actual layout depends on the local conditions.

1. System type (shown here as a placeholder)
2. Year of manufacture
3. Project number
4. Application temperature range
5. Operating pressure of the extinguishing agent containers
6. Authorized Distributor (shown here as a placeholder)

Fig. 2: System labeling (example)
Identification of the extinguishing zones

The owner must attach a sign to the access doors to identify the extinguishing zone, warning of the existence of a fire suppression system and the risks involved.

The text marked in Fig. 3 states:
- This area is protected by a VSH200 fire suppression system
- Do NOT enter unless automatic release is isolated
- Do NOT enter unless isolate valve is in the closed position

Alternatively, there are two additional variants for the text, the use of which is regulated by NFPA 2001 or local provisions.

Fig. 3: Identification of the extinguishing zones

Non-toxic, non-flammable gas

This sign identifies containers containing non-toxic and non-flammable gases.

Inhaling high concentrations of these gases is hazardous to a person's health. Coming into contact with liquefied gas involves the risk of sustaining frostbite.

Protect the containers from tipping over and falling down as well as from heating, impact, and shock. Keep away from sparks, flames, and other sources of ignition. Do not smoke. The extinguishing agent containers are subject to labeling requirements.

Type plate – extinguishing agent container

There is type plate on every container providing specific information about this container. It contains the specifications listed below.
### Safety

**Fig. 4: Type plate – extinguishing agent container**

1. Filled extinguishing agent with specifications on environmental protection and transport (brand designation shown as placeholder)*
2. Manufacturer of the fire suppression system (name and address shown as placeholders)*
3. Manufacturer of the extinguishing agent (name and address shown as placeholders)*
4. Type of the fire suppression system (shown as placeholder)*
5. Field to be filled out by the filling company
6. Mass units, lbs/psi or kg/bar
7. Weight of the extinguishing agent container, full (including valve, without protective valve cap)
8. Weight of the extinguishing agent container, empty (including valve, without protective valve cap)
9. Date of first filling/designation of the first filler
10. Project number
11. Weight of the extinguishing agent
12. Maximum permissible weight loss
13. System pressure at 21 °C (70 °F)
14. Part number of the extinguishing agent container
15. Field to be filled out by the filling company
16. Specification of the type of pressure test of the extinguishing agent container
17 Filling company (name and address shown as placeholders)
18 Field to be filled out by the Authorized Distributor
19 Specification of regulations with which the system complies
20 Warnings, system handling, filling and maintenance instructions

* Will be imprinted on the type plate by the manufacturer

**Languages**

The extinguishing agent containers are delivered with original type plates in German and English. Type plates in other languages have to be ordered. Please contact your Authorized Distributor.

*All specifications missing in these type plates have to be copied from the original type plate by the Authorized Distributor. This also applies to specifications of original type plates, that are printed by the manufacturer or completed by the filling company.*

**Marking extinguishing agent containers with the UL mark/FM mark**

Extinguishing agent containers filled in accordance with UL requirements, are marked in the factory with a UL sticker. Retroactive marking of extinguishing agent containers with the UL mark that are not factory marked is not permitted.

Extinguishing agent containers filled in accordance with FM requirements, are marked in the factory with a FM sticker. Retroactive marking of extinguishing agent containers with the FM mark that are not factory marked is not permitted.
2.9 Environmental protection

NOTICE

Danger to the environment due to incorrect handling of materials that can harm the environment!

– Always heed the notes below about the handling of materials that can harm the environment and their disposal.

– If materials that can harm the environment accidentally escape into the environment, take suitable measures immediately. In case of doubt, inform the responsible local authority about the damage and ask what suitable measures to take might be.

In case of incorrect handling of materials that can harm the environment, especially improper disposal, there can be significant damage to the environment.

The following materials that might harm the environment are used:

Extinguishing agent HFC-227ea

The extinguishing agent must be disposed of in accordance with all applicable local waste disposal regulations. Follow the safety data sheet for the extinguishing agent (Appendix).

HFC-227ea is marketed by several manufacturers under different trade names:

- FM-200™ from Chemours™
- MH227® by Shanghai Waysmos
- Solkaflam® 227 by Solvay

HFC-227ea has an ozone decomposition potential of zero. The GWP (Global Warming Potential) is 3220 (33 years). Consequently in some countries and regions the use of fluorinated greenhouse gases for extinguishing purposes is prohibited and subject to specific requirements.

2.10 Operator's responsibility

Owner

The owner is the person or entity that operates the equipment himself/itself for commercial or economic purposes, or who transfers the device to a third person for use/application, and who bears the legal responsibility for protecting the user, personnel, or third parties.
Owner's obligations

- It is the owner's responsibility to ensure that the system complies with the provisions and regulations applying to the operation of fire suppression systems using the extinguishing agent HFC-227ea and verify the system's operability. In this regard the following particularly applies:
  - comply with the applicable NFPA 2001 regulations as well as all additional local regulations applying to the operation of the system.
  - always observe the inspection intervals specified in this manual.
  - perform these inspections and operate the system following the operating instructions described throughout this manual.
  - document the results of the inspections in the report log.
  - report any detected defects and/or damage to the Authorized Distributor.
  - document all shutdowns and faults the system experiences in the report log of the system.

- The “Occupational Safety and Health Act” of 1970 specifies that a safe workplace must be provided at all times for execution of tasks. To this end, the owner must ensure that the system is inspected and operated in accordance with all applicable commercial, industrial, local, federal and state laws, standards and regulations.

- The owner must ensure that the personnel performing the work have the qualifications necessary to complete the task.

- The owner must ensure that all employees working in the protected enclosure of the system have been informed of the existence of the system and know the risks involved and the steps necessary to handle the system (e.g. behavior in the event of a fire or inadvertent activation).

- The owner must appoint a person in charge of the system, who will be instructed by the Authorized Distributor about how the system operates and the sequence of operation. The owner will confirm in the documentation of the Authorized Distributor that these instructions have been given.

- The owner must confirm to the Authorized Distributor that the system's function and mode of operation have been understood and the system was ready for operation when accepted by the owner.
Safety

- The owner must ensure the availability of substitute extinguishing agents suitable for fire fighting in case the system is taken out of operation/disassembled.
- The owner must identify all extinguishing zones and specify that they are equipped with a fire suppression system.
3 Design and function

Abstract

Single zone systems safeguard one protected enclosure and can be composed of one or several extinguishing agent containers.

Single zone systems equipped with only one extinguishing agent container (single container systems) have an electric release device (also available with a mechanic blocking device). The device is fitted on the valve of the extinguishing agent container and activated by the fire suppression detection system. There is also the option of fitting a manual release device on the electric release device in order to allow the system to be activated manually.

Multi container systems are equipped with several extinguishing agent containers which are connected by a pilot line. These are required, for instance, if you wish to safeguard an extensive protected enclosure. The first extinguishing agent container ("control cylinder") of a multi container system lacking a pneumatic release device (PAE) is activated electrically (and, as an option, manually as well) as is the case with the extinguishing agent container of a single container system. All other extinguishing agent containers ("Slave") are activated pneumatically via a pilot line.

Multi container systems equipped with a pneumatic release device (PAE) have a pilot cylinder that is activated electrically. The CO$_2$ contained in the pilot cylinder flows through the pilot line to the pneumatic release devices, mounted on the extinguishing agent containers, and opens them.

In contrast to single container systems, the extinguishing agent released in a multi container system first flows from the hose via check valves to a manifold. The extinguishing agent flows from there through the nozzle pipeline to the discharge nozzles where it evaporates and exits into the extinguishing zone.

Design and function

Abstract

Multi zone systems safeguard several extinguishing zones. If the extinguishing zones are of different sizes, multi zone systems will be equipped with several extinguishing agent containers. The extinguishing agent supply and, thus, the number of extinguishing agent containers always follow the largest extinguishing zone. When activated, the system will only flood one extinguishing zone.

Multi zone systems are equipped with a pneumatic release device (PAE). The pilot cylinder of these systems is activated electrically when a fire is detected. The CO₂ contained in the pilot cylinder flows through the pilot line to the pneumatic release devices, mounted on the extinguishing agent containers, and opens them.

Pilot distributors and selector valves ensure that the extinguishing agent containers assigned to the associated extinguishing zone open and the corresponding pipings are released. This prevents the extinguishing agent from flowing into extinguishing zones that are not affected by fire.

Just as the extinguishing agent of single zone systems equipped with several extinguishing agent containers, the extinguishing agent of multi zone systems first flows, when the system is activated, from the hose via check valves to a manifold. The extinguishing agent flows from there via the selector valves and the nozzle pipe to the discharge nozzles (Fig. 8/arrow) where it exits and vaporizes into the extinguishing zone.

3.3 Functional description

As soon as the detection system installed in the protected enclosure detects a fire, an alarm will be triggered by the fire suppression detection system. A pulse is transmitted to the electric release devices after the specified pre-discharge timer has expired. Afterwards, the quick release valves of the pressurized extinguishing agent containers open.

The liquid extinguishing agent flows into the pipeline system. The check valves installed in the pipeline system prevent the extinguishing agent from flowing back into the container. The extinguishing agent flows to the discharge nozzle(s) of the system which are installed in the protected enclosure.
The extinguishing agent vaporizes at the discharge nozzles and is dispersed across the extinguishing zone as a gaseous mix made up of extinguishing agent and air. This suppresses the fire by extracting heat energy from the flames. Throughout the extinguishing process, the oxygen concentration in the extinguishing zone is slightly reduced. The retention time (hold time) of the extinguishing zone must comply with NFPA 2001.

In addition to the automatic, electric release, electric manual releases can be used to activate the system manually. These releases are installed at the extinguishing zone.

3.4 Description of important components

3.4.1 Extinguishing agent container with valve

The extinguishing agent is stored in extinguishing agent containers (Fig. 9/3). These containers are designed, manufactured and labeled in accordance with European directives, the standard of the US Department of Transportation (D.O.T), or in accordance with the country-specific pressure equipment directives.

The extinguishing agent containers have a siphon tube and are, thus, only suitable for upright operation. Attached to the extinguishing agent container is a type plate which contains, among other things, maintenance and filling instructions as well as information about the fill quantity. By default, the containers are painted red and must be secured (Fig. 9/4).
Containers must not be moved and transported unless fitted with the protective valve cap (Fig. 10/1) and the anti-recoil cap (Fig. 11/1). When filled, the containers must be labeled and transported as hazardous material in accordance with all applicable local regulations.

The valve (Fig. 12/1) is on the extinguishing agent container. This makes it possible to discharge the extinguishing agent within 10 s.

A contact pressure gauge (Fig. 12/2) is on the valve, it indicates the fill pressure of the container, there is also a bursting disk that is used to protect against overpressure. Contact pressure gauges enable additional monitoring of the fill pressure.

There is also an option of connecting an additional pressure switch to the valve or the pipeline, which will switch a potential-free electrical contact when the system is activated. The switching status of this contact can be monitored by the fire suppression detection system and, thus, indicate an activation of the system.
For better readability in this manual, instead of the term “pressure gauge/contact pressure gauge” only the term “contact pressure gauge” is used below.

Multi container systems

Fig. 13: Multi container system

Multi container systems are always equipped with a “control cylinder” extinguishing agent container (Fig. 13/1) or a pilot cylinder combined with a varying number of slave extinguishing agent containers (Fig. 13/2+3). The number of slave extinguishing agent containers varies with the number and size of the extinguishing zones and is determined when the system is designed. The number of slave containers is not optional.

While the “control cylinder” extinguishing agent container is released electrically, pneumatically, pneumatically/manually or manually, the slave extinguishing agent containers are always released and opened by the “control cylinder” extinguishing agent container or the pilot cylinder pneumatically via a pilot line. The length of the pilot line is not optional.
3.4.2 Weighing device

The weighing device (Fig. 14/2) is part of the pneumatic release device (PAE). It is used to detect and indicate any leakage at the pneumatic release device (PAE). If leakage is detected, the counterweight will tilt down to make the leakage instantly visible.

A leakage is indicated by the specified difference between the weight of the container and a counterweight (Fig. 14/1). The pilot cylinder is hooked into the weighing device by means of holding rods (Fig. 14/3).

Fig. 14: Weighing device

3.4.3 Liquid level indicator

Some extinguishing agent containers are equipped with a liquid level indicator (Fig. 15/2). The level indicator is non-electrical and enables manual read-out of the fill level on an integrated tape measure (Fig. 15/1). Inside the extinguishing agent container a float equipped with a magnet moves on the stem of the liquid level indicator.

Liquid level indicators have been designed to resist shock and vibration. However, shock and vibration should be avoided.

Fig. 15: Liquid level indicator
4 Transport and storage

4.1 Transport

Improper transport

**WARNING**

Danger to life from faulty transport!

- Allow only the Authorized Distributor or service personnel authorized by the Authorized Distributor to transport the components of the system.
- Avoid unauthorized transport and location changes - including transporting and moving the extinguishing agent containers.

Errors occurring during transport may lead to life-threatening situations and cause significant property damage.

*System components may only be transported by an Authorized Distributor or service personnel authorized by the Authorized Distributor. Contact can be established through the manufacturer (see page 2).*

Pressurized extinguishing agent

**WARNING**

Danger of injury due to pressure in extinguishing agent containers!

- Do not transport or store extinguishing agent containers unless they are sealed with a protective valve cap and an anti-recoil cap.
- Have damaged extinguishing agent containers replaced immediately by the Authorized Distributor.

If pressurized extinguishing agent containers are damaged and extinguishing agent escapes uncontrollably, there is a risk of severe injuries or even death.

4.2 Storing extinguishing agent containers

Storing extinguishing agent containers

Store spare containers of extinguishing agent in the following conditions:

- Do not store outside.
- Store in a dry area.
- Do not expose to abrasive media.
- Protect against direct sunlight.
- Avoid mechanical vibrations.
Transport and storage

- Avoid condensation moisture.
- Storage temperature: -18 to +50 °C (0 to +122 °F).
- Store with the protective valve cap installed.
- Store only upright inside the included transport frame or lying on the included pallet.
- When storing them for a period of more than 3 months, inspect the overall condition of all extinguishing agent containers on a regular basis. If necessary, contact an Authorized Distributor to replace any damaged or corroded extinguishing agent containers. Contact can be established through the manufacturer (see page 2).

**WARNING**

- Keep all safety, warning and operating instructions easily legible at all times.
- Replace any damaged signs or labels immediately (or have them replaced).

Over the course of the storage period, labels and signs can become soiled or illegible in some other way, which may result in risks no longer being detected and the necessary operating instructions no longer being followed. This will lead to risk of injury.

---

**The packing pieces may contain instructions that exceed the requirements specified herein. Follow these additional instructions accordingly.**
5 Installation and commissioning

The system may be installed and put into operation only by the Authorized Distributor or service personnel authorized by the Authorized Distributor.

**WARNING**

Danger to life from faulty installation and commissioning!

- Allow only the Authorized Distributor or service personnel authorized by the Authorized Distributor to install and commission the system.
- Avoid any unauthorized assembly and installation - including subsequent assembly and installation (also of subcomponents).

Errors occurring while the system is being installed or put into operation may lead to life-threatening situations and cause significant property damage.

**DANGER**

Danger of injury due to pressure in extinguishing agent containers!

- Allow only the Authorized Distributor or service personnel authorized by the Authorized Distributor to transport extinguishing agent containers.
- Make sure the extinguishing agent container is adequately braced utilizing clamps.
- Have damaged extinguishing agent containers replaced immediately by the Authorized Distributor.
- Ensure that the valve outlet is always closed with an anti-recoil cap and connected to a pipeline.

If pressurized extinguishing agent containers are damaged and extinguishing agent escapes uncontrollably, there is a risk of death.
6 Operation

6.1 Required tools

The following tools are required to operate the system:

**Screw reset tool (887645)**
The screw reset tool is used to reset a previously activated electric release device.

**Wrench**
Wrenches of different sizes

6.2 Isolating the system

If the work performed inside the protected enclosure makes it difficult to leave the protected enclosure within the pre-discharge timer, the system must be isolated for safety reasons.

This is also necessary in cases where work is performed on the fire suppression detection system or if the work may set off the system inadvertently - for instance, during welding operations. Isolating the system prevents the extinguishing agent from being released accidentally.

Multi zone and single zone systems equipped with a pneumatic release device (PAE) are fitted with blocking devices that are installed in the pneumatic pilot line and can be used to isolate the system. Single container and multi container systems that lack a pneumatic release device (PAE) are equipped with an electric release device that comes with an integrated blocking device.
6.2.1 Warnings regarding the isolation of the system

Fire hazard when system is isolated

![WARNING]

- Danger to life from fire!
  - Keep potential fire loads and sources of ignition away from the protected enclosure.
  - Maintain fire protection by, for example, keeping fire extinguishers readily available.
  - Do not shut down the system longer than necessary.

When work is performed on the system or inside the protected enclosure and the system is shut down for this purpose, no fire protection will be in place. Fires that cannot be controlled during this time may cause severe injuries including death and result in significant property damage.

Inappropriate isolation

![WARNING]

- Danger to life from inappropriate isolation!
  - Do not isolate the system unless necessary.
  - Ensure that the system cannot be isolated by an unauthorized person.

When isolated, the system does not provide any fire protection. The suppression system is out of service.

Improper isolation

![WARNING]

- Risk of injury from improper isolation!
  - Allow only the person in charge of the system to isolate the system.
  - Make sure the isolation of the system cannot be reset by third parties in an unregulated manner.
  - When isolating the system, follow the specifications and instructions contained in this document.

If isolated improperly, the system may be activated inadvertently. This may lead to severe injuries and significant property damage caused by discharged extinguishing agent.
6.2.2 Isolating a single zone system equipped with an electric release device

Without mechanical blocking device

Personnel: Person in charge of the system
Protective equipment: Safety gloves, Protective goggles

1. Maintain fire safety by, for example, keeping fire extinguishers readily available.
2. Unscrew the electric release device (Fig. 16/1) fitted on the "pilot cylinder" extinguishing agent container from the valve (Fig. 16/2).
3. If the status of the release devices (installed/removed) is monitored by additional limit switches, make sure the deactivation of the system is indicated on the fire detection and extinguishing control panel.

Fig. 16: Unscrewing the release device

With mechanic blocking device* not UL

Personnel: Person in charge of the system
Protective equipment: Safety gloves, Protective goggles
Special tool: Wrench

1. Maintain fire safety by, for example, keeping fire extinguishers readily available.
2. Undo the hexagon nut (Fig. 17/1) on the electric release device using a wrench.
3. Turn the manual lever (Fig. 17/2) on the electric release device to the "blocked" position.
4. Use a wrench to tighten the hexagon nut (10 Nm ± 2 Nm (7.38 ± 1.48 lb•ft)) as the isolation will otherwise not take effect.
   ⇒ The system has been isolated.
5. Make sure the isolation is indicated on the fire detection and extinguishing control panel.

Fig. 17: Isolating the release device
6.2.3 Isolating a single zone system equipped with a pneumatic release device (PAE)

Personnel:
- Person in charge of the system

Protective equipment:
- Safety gloves
- Protective goggles

Single zone systems equipped with a pneumatic release device (PAE) are used whenever more than one extinguishing agent container is needed to safeguard the protected enclosure. The blocking device used by these systems is a ball valve.

1. Maintain fire safety by, for example, keeping fire extinguishers readily available.

2. Open and remove the padlock on the blocking device.

3. Turn the ball valve (Fig. 18/1) of the blocking device as far as it will go in clockwise direction (Fig. 18/arrow).
   - The "isolation" labeling on the ball valve becomes visible, indicating the system has been isolated.

4. Hook the padlock into the locking eye (Fig. 18/2) of the blocking device and lock it.

5. Pull the key from the padlock and store it in a safe place to prevent unauthorized personnel from resetting the isolation.

6. Make sure the isolation is indicated on the fire detection and extinguishing control panel.
6.2.4 Isolating a multi zone system* not UL, not FM

Personnel:  ■ Person in charge of the system

Protective equipment:
  ■ Safety gloves
  ■ Protective goggles

Multi zone systems are equipped with blocking devices for each individual extinguishing zone. This makes it possible to isolate each extinguishing zone individually without the need to shut down the entire system.

1. Maintain fire safety by, for example, keeping fire extinguishers readily available.

2. Open and remove the padlock on the blocking device.

3. Turn the ball valve (Fig. 19/1) of the blocking device as far as it will go in clockwise direction (Fig. 19/arrow).

   ⇒ The "isolation" labeling on the ball valve becomes visible, indicating the corresponding extinguishing zone has been isolated.

4. Hook the padlock into the locking eye (Fig. 19/2) of the blocking device and lock it.

5. Store the key of the padlock in a safe place to prevent unauthorized personnel from resetting the isolation.

6. Make sure the isolation is indicated on the fire detection and extinguishing control panel.

![Fig. 19: Blocking device (optionally with 1 or 2 limit switches)]
6.3 Resetting the isolation

6.3.1 Warnings regarding the resetting of the blocking

Failure to reset

⚠️ WARNING

Danger to life from failure to reset the isolation!
- Do not shut down the system longer than necessary.
- Reset the isolation without delay when all work is complete.

When isolated, the system does not provide any fire protection in the assigned extinguishing zone. There is danger to life and a risk of significant property damage in case a fire erupts.

Early resetting

⚠️ WARNING

Danger of injury from resetting the isolation prematurely!
- Do not reset the isolation until all work that may cause inadvertent activation is complete.
- Allow only the person in charge of the system to reset the isolation.
- Make sure the isolating of the system cannot be reset by third parties in an unregulated manner.

If the isolation of the system is reset while work is still being performed in the extinguishing zone, the system may be activated inadvertently. This may lead to injury and significant property damage caused by discharged extinguishing agent.

Reset on activation

⚠️ WARNING

Risk of injury from resetting the isolation during an activation!
- Do not reset the isolation until no release device is being actuated.

If the isolation is reset while a pneumatic or electric release device is being actuated, the system will be activated instantaneously.
6.3.2 Resetting the isolation of a single zone system equipped with an electric release device

Without mechanical blocking device

Personnel: Person in charge of the system

Protective equipment:
- Safety gloves
- Protective goggles

Special tool: Screw reset tool (887645)

1. Ensure that the fire detection and extinguishing control panel do not indicate an alarm and that the system is not currently activated.

2. Screw the screw reset tool (Fig. 20/2) into the electric release device (Fig. 20/1).
   ⇒ Press the release pin into the inactive position to hide the red color marking on the release pin.

3. Unscrew the screw reset tool (Fig. 20/2) out of the electric release device.

4. Ensure that the release pin (Fig. 21/1) of the electric release device is not active.
5. Screw the electric release device (Fig. 22/1) onto the valve (Fig. 22/2) of the associated extinguishing agent container and tighten with 50 +0/-15Nm (36.878 +0/-11.063 lb-ft) until it metallurgically rests on the valve.

   *Just before the release device rests on the valve (approximately the last 10mm (0.4 inches)), the resistance when screwing on will increase.*

6. Check whether the release device is firmly seated on the extinguishing agent container.

   ⇒ The deactivation has been reset.

7. If the status of the release devices (installed/removed) is monitored by additional limit switches, make sure the deactivation of the system is no longer indicated on the fire detection and extinguishing control panel.

---

**With mechanical blocking device**

Personnel:
- Person in charge of the system

Protective equipment:
- Safety gloves
- Protective goggles

Special tool:
- Wrench

1. Ensure that the fire detection and extinguishing control panel do not indicate an alarm and that the system is not currently activated.

2. Undo the hexagon nut (Fig. 23/1) on the electric release device using a wrench.

3. Turn the manual lever (Fig. 23/2) on the electric release device to the "Operation" position.

4. Use a wrench to tighten the hexagon nut (10 Nm ± 2 Nm (7.38 ± 1.48 lb-ft)).

5. Ensure that the fire detection and extinguishing control panel signal the operational readiness of the electric release device and the electric release device is not blocked.

   ⇒ The isolation has been reset.
6.3.3 Resetting the isolation of a single zone system equipped with a pneumatic release device (PAE)

Personnel:
- Person in charge of the system

Protective equipment:
- Safety gloves
- Safety footwear
- Protective goggles

1. Ensure that the fire detection and extinguishing control panel do not indicate an alarm and that the system is not currently activated.

2. Ensure that the pilot cylinder of the pneumatic release device (PAE) is not open and that no pressure is applied to the pilot line.

   If the valve lever (Fig. 24/1) is thrown and the release pin (Fig. 24/2) is protruding, the pilot cylinder is open. Do not reset the isolation in this case and consult the Authorized Distributor.

3. Open and remove the padlock at the locking eye (Fig. 25/2) of the blocking device.

4. Turn the ball valve (Fig. 25/1) of the blocking device as far as it will go in counterclockwise direction (Fig. 25/arrow).

   The "Operation" labeling on the ball valve is visible, indicating that the isolation of the release device has been reset.

5. Hook the padlock into the locking eye (Fig. 25/2) of the blocking device and lock it.

6. Pull the key from the padlock and store it in a safe place to prevent unauthorized personnel from isolating the system or parts thereof.

7. Make sure the isolation is no longer indicated on the fire detection and extinguishing control panel.
6.3.4 Resetting the isolation of a multi zone system* not UL, not FM

Personnel: □ Person in charge of the system

Protective equipment:
□ Safety gloves
□ Safety footwear
□ Protective goggles

1. Ensure that the fire detection and extinguishing control panel do not indicate an alarm and that the system is not currently activated.

2. Ensure that the pilot cylinder of the pneumatic release device (PAE) is not open and that no pressure is applied to the pilot line.

   If the valve lever (Fig. 26/1) is thrown and the release bolt (Fig. 26/2) is protruding, the pilot cylinder is open. Do not reset the isolation in this case and consult the Authorized Distributor.

3. Open and remove the padlock at the locking eye (Fig. 27/2) of the blocking device.

4. Turn the ball valve (Fig. 27/1) of the blocking device as far as it will go in counterclockwise direction (Fig. 27/arrow).

   The "Operation" labeling on the ball valve is visible, indicating that the isolation of the release device has been reset.

5. Hook the padlock into the locking eye (Fig. 27/2) of the blocking device and lock it.

6. Pull the key from the padlock and store it in a safe place to prevent unauthorized personnel from isolating the system or parts thereof.

7. Make sure the isolation is no longer indicated on the fire detection and extinguishing control panel.
6.4 Resetting the isolation in the event of fire

If the system is isolated when activated in the event of a fire, the isolation can be reset retroactively.

The isolation cannot be reset retroactively unless the control voltage is still supplied to the fire suppression detection system. As some fire suppression detection systems send only a single pulse, releasing the system retroactively is not possible with these types of control panels.

1. Make sure no one is still inside the extinguishing zone.

2. To reset the isolation, set the blocking device to the Operation position.

   If the system was isolated by removing the release devices because it is not equipped with a blocking device, it must not be put back into operation immediately by refitting the release devices.

   The extinguishing agent containers open instantaneously.

3. Leave the extinguishing zone immediately.

6.5 Activating the system

WARNING

Danger of injury due to escape of gas under pressure!

– Wear protective goggles and safety gloves.
– When triggered, maintain some distance to the release device and turn your face away from the release device.

When triggered, pressurized gas briefly escapes from the area between the valve of the extinguishing agent container and the release device. If the gas directly contacts unprotected body parts, and in particular the face, there is a risk of severe or even fatal injuries.
The system is activated automatically by fire alarm systems installed in the protected enclosure. Other options to activate the system manually vary with the design of the system.

- Electric manual release at the extinguishing zone
- Manual activation at the "master" extinguishing agent container or the pilot cylinder

*If a release device has been activated, the activation of the system can no longer be stopped or interrupted.*

**This will happen after an activation**

1 - If one or several fire alarm systems (depending on the system design), the fire detection system or a manual release are activated, the alarm will be transmitted to the fire detection and extinguishing control panel.

2 - A buzzer will sound on the fire detection and extinguishing control panel.

3 - All connected, central ventilation and air conditioning units as well as any other devices, for example the power supply, will be switched off. Fireproof doors and windows equipped with automatic locking mechanisms will be locked.

Air conditioning units in recirculation mode, if available, may continue to be operated in order to cool sensitive electrical components. This also promotes the mixing of the gaseous extinguishing agent in the enclosure.

4 - The alarm devices will be activated.

5 - The selector valves of the corresponding extinguishing zone (only for multi zone systems) will open.

6 - The set pre-warning time will start counting down.

7 - When the pre-warning time has elapsed, the valves of the extinguishing agent containers will open and the extinguishing agent will flow through the pipeline system to the discharge nozzles within the set flooding time.

8 - The extinguishing agent will evaporate at the discharge nozzles and be spread across the extinguishing zone.

9 - The hold time of the extinguishing agent, during which its effective concentration for suppressing fires is retained, will start counting down.
Operation

If the system is activated by pneumatic/manual release devices or manual release devices, the activation will be immediate without any visual or acoustic alarm device.

Pre-discharge timer

The pre-discharge timer is the time between the release of the main alarm and the beginning of the fire extinguishing process. It is usually set to 10 s.

All persons within the affected extinguishing zone must leave within this period and lock all access doors and windows in the extinguishing zone that are not equipped with automatic locking devices.

Fireproof doors that have already been closed can be opened at any time to provide an exit from the extinguishing zone.

6.5.1 Activation by electric manual release

Risk of injury from broken glass!

- If available, use a suitable break-proof object (e.g. a shoe) to smash the pane in order to protect your hands.
- If no suitable objects are available, protect your hand by wrapping a rag or similar material around your hand when smashing the pane.
- When smashing the pane, turn your face away from the electric manual release to protect your eyes from any broken glass that may be flying around.

Smashing the pane of an electric manual release may cause cutting injuries.

1. Use caution when smashing the pane of the electric manual release and turn your face away.

2. Press the release button.

   The system has been activated, and the electric alarm equipment (e.g. signal horn, signal lights) is triggered immediately.

3. Leave the protected enclosure immediately.
6.5.2 Activation by pneumatic/manual release device

Protective equipment:
- Safety gloves
- Protective goggles

1. **WARNING! Danger of injury due to escaping extinguishing agent!**
   Make sure no one is still inside the extinguishing zone.

2. With multi zone systems, open the selector valve of the affected extinguishing zone.

3. Pull the safety pin (Fig. 28/2) out of the pneumatic/manual release device on the “pilot cylinder” extinguishing agent container.

4. **WARNING! Danger of injury due to escape of gas under pressure!**
   When the release lever is operated, the upper valve chamber in the valve is vented. Pressurized gas flows through it through a pressure relief hole in the cap nut of the release device (Fig. 28/3).

5. Press the release lever (Fig. 28/1) of the pneumatic/manual release device as far as it will go clockwise or counterclockwise (Fig. 28/arrow) and hold it down for 5 s.
   - The system will be activated immediately.

6. Leave the extinguishing zone immediately.
6.5.3 Activation by manual release device

Protective equipment:
- Safety gloves
- Protective goggles

1. Pull the safety pin (Fig. 29/1) out of the manual release device.

2. When the release lever is operated, the upper valve chamber in the valve is vented. Pressurized gas flows through it through a pressure relief hole in the cap nut of the release device (Fig. 29/3).

**WARNING!** Danger of injury due to escape of gas under pressure!

When triggering this, maintain your distance to the release device, turn away from the pressure relief hole and wear protective equipment.

3. Press down the release lever (Fig. 29/2) of the manual release device as far as it will go (Fig. 29/arrow) and hold it down for 5 s.

   ⇒ The system will be activated immediately.

4. Leave the extinguishing zone immediately.

6.6 Actions after the system is activated

Steps to be taken after a fire

**WARNING**

Personnel: Person in charge of the system

Life-threatening danger through the occurrence of decomposition products and fire smoke!

- Never enter the extinguishing zone without a self-contained breathing apparatus.
- Do not re-enter the affected rooms until the fire department has given the all-clear.
- Follow the instructions given by the rescue workers.

If the fire energy is high, hydrogen fluoride as a product of thermal decomposition will form during the extinguishing process alongside the toxic smoke gases produced by the process. This substance is extremely caustic and will cause significant long-term and chronic harm to a person’s health merely upon contact with the skin.
**WARNING**

Danger to life from re-ignition!
- Do not re-enter the affected rooms until the fire department has given the all-clear.
- Be prepared for re-ignition at all times. Keep suitable extinguishing agents (e.g. fire extinguishers) on hand when ventilating the extinguishing zone.

When the effective concentration of the extinguishing agent drops due to the ventilation of the extinguishing zone, the fire may be reignited by any sources of ignition that may still exist. There is a risk of sustaining severe or fatal injuries.

1. Do not re-enter the affected rooms until the fire department has given the all-clear.
2. Enter the extinguishing zone under the supervision of the fire department and open windows and doors.
3. Keep an eye on the fire sources that have been put out.
4. Do not clear the extinguishing zone for access until it has been sufficiently ventilated and there are no remnants of extinguishing agent left.
5. Notify the Authorized Distributor or service personnel authorized by the Authorized Distributor so that the operational readiness of the system can be restored.

\[\text{i} \quad \text{Do not replace extinguishing agent containers without authorization even if they are empty.}\]

6. Perform function checks \(\triangleright\) Chapter 7 “Inspections” on page 60.

**Steps after faulty activation**

**Personnel:**
- Person in charge of the system

If no fire has occurred, the all-clear from the fire department is not necessary in case of a faulty activation of the system.
Operation

In addition to the instructions specified below, all applicable local regulations regarding the behavior in the event of an activation of automatic fire suppression systems must be observed.

1. Make sure that no unauthorized persons can enter the affected premises before they have been cleared for access by the person in charge of the system.

2. Enter the extinguishing zone carrying substitute extinguishing agents (e.g. fire extinguisher) and open windows and doors to ventilate the area.

   Have the extinguishing agent extracted by the fire department in lower situated premises where sufficient ventilation cannot be achieved.

3. Do not clear the extinguishing zone for access until it has been sufficiently ventilated and there are no residues of extinguishing agent remaining.

4. Notify the Authorized Distributor or service personnel authorized by the Authorized Distributor so that the operational readiness of the system can be restored.

   Do not replace extinguishing agent containers without authorization even if they are empty.

5. Perform function checks \( \triangleright \) Chapter 7 “Inspections” on page 60.
6.7 Reading the fill level

Personnel:  ■ Person in charge of the system
Protective equipment:
  ■ Protective goggles
  ■ Extinguishing-agent-resistant safety gloves

**WARNING**

Danger of injury due to extinguishing agent escaping under pressure!

– Do not unscrew the brass hexagon (Fig. 30/3) of the liquid level indicator.

If the liquid level indicator has been unscrewed from the extinguishing agent container, there is danger of severe or fatal injury.

1. Unscrew the plastic protective cap (Fig. 30/1).
2. Pull tape measure (Fig. 30/2) out of the liquid level indicator to the stop.
3. Slowly lower the tape measure into the liquid level indicator until a slight pull is felt.
   ✜ The measuring tape is arrested magnetically on the float.
4. Read the fill level on the measuring tape above the threaded union (Fig. 30/arrow).
5. Detach the measuring tape (Fig. 30/2) from the float with rapid hand movement, and lower it completely into the liquid level indicator.
6. Screw on the plastic protective cap (Fig. 30/1).

A detailed description for checking the amount of extinguishing agent by means of the liquid level indicator can be found in the installation and maintenance manual.
7 Inspections

Interval

Listed below are important inspections necessary to ensure that the system functions properly, at its best efficiency and without failure. Perform these inspections on a **weekly** basis and record the performance in the report book.

Contact an Authorized Distributor if you have any questions concerning the inspections that need to be performed. Contact can be established through the manufacturer, see page 2.

*A master copy containing all mentioned inspection questions is included as a checklist in the Appendix to this manual.*
Inspections

Personnel:
- Person in charge of the system

Protective equipment:
- Safety gloves
- Protective goggles

**WARNING**

- **Danger of injury from faulty release!**
  - Activate the system only in the event of a fire.
  - Protect the manual release devices in the protected enclosure from faulty release.
  - Refrain from smoking inside the protected enclosure.
  - Before performing any work generating heat and smoke, block the system.

**A faulty release of the system may cause severe injuries and property damage.**

1. **Clean the system**
   - **Chapter 8.2 “Cleaning the system” on page 64.**

2. **Check the operability of the system weeky** based on the following questions.

   - Does the contact pressure gauge show system pressure? The pressure varies with the system design and amounts to 25 bar (360 psi), 42 bar (610 psi) or 50 bar (725 psi) at 21 °C (70 °F).
   - Have all extinguishing agent containers been fitted with release devices?
   - Have all extinguishing agent containers been sufficiently fastened with a clamp?
   - Do the extinguishing agent containers contain the required quantity – including any potential reserve quantities in accordance with the installation attest?
   - Are the extinguishing agent containers, valves, release devices, hoses, selector valves, non-return valves, and pneumatic pilot lines in sound condition?
   - Are the electrical pilot lines leading to the fire detection and extinguishing control panel and the equipotential bonding connected properly and in sound condition?
   - Are the pipe system, the pipe clips and the discharge nozzles intact?
   - Are the alarm devices intact?
   - Are the manual release elements accessible and in sound condition?
   - Are the automatic fire detectors intact?
Inspections

- Are the discharge zones of the discharge nozzles unobstructed?
- Are all wall breakthroughs sealed off to the adjoining areas?
- Are the pressure relief dampers closed?
- Are the flow openings of the pressure relief dampers unobstructed?
- Are all structural openings (windows, doors) closed or fitted with operational automatic locking devices?
- Are the escape routes of the protected enclosure unobstructed?
- Are additional fire loads (e.g. boxes, packaging material) removed from the protected enclosure?
- Have all information signs of the system been attached and is the information they contain easily legible?
- Does the fire detection and extinguishing control panel show line voltage?
- Is no fault displayed on the fire detection and extinguishing control panel?

If one or several of these inspection questions cannot be answered with "Yes" or if you are uncertain as to the correct answer, please contact an Authorized Distributor immediately. Contact can be established through the manufacturer, see page 2.
8 Cleaning

8.1 Warnings regarding the cleaning of the system

Faulty activation

**WARNING**

Risk of injury from faulty activation!

- Always use caution when cleaning the component surfaces of the system.
- Clean the fire detection and release devices (e.g. electric manual releases, smoke detectors) as specified by their respective manufacturers.
- Avoid stirring up dust.

Cleaning the surfaces of the system components may set off the system if too much dust is stirred up, too much manual pressure is exerted or the release devices are activated by accident. This may result in injury and significant property damage.

Cleaning agents

**NOTICE**

Property damage from abrasive cleaning agents!

- Use only water to clean the surfaces of the components.
- Never clean the system using acids, bases or other cleaning agents containing acid.

Acids and bases may cause significant property damage to the system and its components.

Cleaning equipment

**NOTICE**

Property damage from wrong cleaning equipment!

- Use only a damp cloth to clean the surfaces of the components.
- Never use files, grinders or similar cleaning equipment that abrade material to remove residue and/or corrosive residue from the component surfaces.

Wrong cleaning equipment may cause significant property damage to the system.
8.2 Cleaning the system

Personnel: ■ Person in charge of the system
Protective equipment: ■ Safety gloves
■ Protective goggles
Materials: ■ Damp cloth

The component surfaces of the system must be cleaned prior to every function check of the system (weekly) in order to, in particular, allow for visual inspections.

1. Use a damp cloth to carefully remove dust and dirt deposits from all surfaces of the components.

2. Report any corrosion damage and/or coating stuck on the component surfaces to the Authorized Distributor.
9 Servicing

Allow only an Authorized Distributor or service personnel authorized by the Authorized Distributor to perform any maintenance and repairs on the system. Contact can be established through the manufacturer (see page 2).
10 Malfunctions

The following section describes possible causes for faults and the work required to correct these faults.

If faults occur frequently or cannot be remedied by following the instructions listed below, contact a company approved to install the system. Contact can be established through the manufacturer (see page 2).

10.1 Warnings regarding troubleshooting

Non-operational system

Risk of death when system is not ready for operation!

- Correct malfunctions (or have malfunctions corrected) immediately.
- Check the system for proper operation before putting it back into service.

If the system experiences malfunctions, it may not be operational. Fires cannot be fought effectively and may lead to severe injuries including death as well as significant property damage.

Improperly performed troubleshooting operations

Risk of injury from improper troubleshooting!

- Have faults that cannot be remedied by following the instructions specified in this section corrected only by the Authorized Distributor or service personnel authorized by the Authorized Distributor.

Improperly performed troubleshooting operations may cause severe injuries and significant property damage.

Behavior if there is a fault

The following always applies:

1. Determine cause of fault using the following fault table.

2. If a fault cannot be remedied by following the instructions specified therein, consult the Authorized Distributor or the service personnel authorized by the Authorized Distributor and have them correct the fault.
3. Notify the owner of all detected faults.

The fault table provided below specifies who is authorized to correct a fault.

10.2 Fault indicators

Possible faults are indicated on the fire extinguishing detection system.

This manual does not include a description of the fire extinguishing detection system. Follow the separate operation manual of the fire extinguishing detection system.

Other indications of faults such as leakage of extinguishing agent are provided by the contact pressure gauge fitted on the extinguishing agent cylinders, the liquid level indicators (if present), and the weighing device of the pneumatic release device (PAE).
## 10.3 Fault table

<td>Person in charge of the system</td>
</tr>
<tr>
<td></td>
<td>Liquid level indicator is defective</td>
<td>Have extinguishing agent quantity checked .through weighing.</td>
<td>Authorized Distributor</td>
</tr>
<tr>
<td></td>
<td>Leakage</td>
<td>Have the extinguishing agent containers replaced.</td>
<td>Authorized Distributor</td>
</tr>
<tr>
<td>The fire suppression detection system displays a short circuit or an interrupted electrical transmission line.</td>
<td>Short circuit or wire break</td>
<td>Check the cable and the connection and have them repaired.</td>
<td>Qualified electrician</td>
</tr>
</tbody>
</table>
10.4 Correcting leakage of extinguishing agent

Personnel:  ■ Person in charge of the system

**NOTICE**

**Material damage due to excessive enclosure temperature!**
- Do not increase the enclosure temperature unless all electrical equipment is safeguarded against overheating.
- Comply with the specifications provided by the manufacturer of the electrical devices. Consult with the manufacturer if in doubt.

**Excessive enclosure temperature (e.g. inside PC or server rooms) may cause electrical equipment to overheat and lead to significant property damage.**

1. Use the installed heating equipment to increase the enclosure temperature to at least 5 °C (41 °F).
2. Check the indicator position on the contact pressure gauge (Fig. 31/1).
   - The indicator of the contact pressure gauge must return to the green area.

![Fig. 31: Indicator position](image)

If the indicator is not in the green area despite the enclosure temperature being above 5 °C (41 °F), either leakage of extinguishing agent has occurred or the contact pressure gauge is defective. Contact the Authorized Distributor of the system.

10.5 Putting the system back into operation after a corrected malfunction

**Important**

Allow only an Authorized Distributor or service personnel authorized by the Authorized Distributor to perform the work necessary to put the system back into operation after the correction of a fault. Contact can be established through the manufacturer (see page 2).
Final shutdown, disassembly, and disposal

11 Final shutdown, disassembly, and disposal

After the end of the facility's useful life has been reached, the facility must be disassembled and disposed of in an environmentally appropriate manner.

11.1 Final shutdown and disassembly

The final shutdown and disassembly of the system must be entrusted to an Authorized Distributor or service personnel authorized by the Authorized Distributor. Contact can be established through the manufacturer (see page 2).

**WARNING**

Danger to life from faulty shutdown and disassembly!

– Allow only the Authorized Distributor or service personnel authorized by the Authorized Distributor to perform the final shutdown and disassembly of the system.
– Do not allow the final shutdown and disassembly to be performed without authorization.

Errors occurring while the system is being shut down and disassembled may lead to life-threatening situations and cause significant property damage.

11.2 Disposal

The components of the system may be disposed of only by the Authorized Distributor or service personnel authorized by the Authorized Distributor. The manufacturer of the extinguishing agent is responsible for its disposal. Contact can be established through the manufacturer (see page 2).

**NOTICE**

Danger to the environment from improper disposal!

– Entrust only the Authorized Distributor or service personnel authorized by the Authorized Distributor with the disposal of the system and its components.
– Allow only the manufacturer of the extinguishing agent to dispose of the extinguishing agent.
– Avoid unauthorized disposal.

Improper disposal may result in danger to the environment.

\(^1\) depending on the design

*For more technical specifications, please refer to the installation and maintenance manual. Contact an Authorized Distributor if necessary. Contact can be established through the manufacturer (see page 2).*
13 Glossary

Approved
Approved by an Authority Having Jurisdiction (ADJ) / competent authority.

Blocking device
Mechanical device used to prevent the extinguishing agent from flowing into the extinguishing zone, e.g. during maintenance, inspections, and repairs inside the extinguishing zone.

Check valves
The check valve allows the extinguishing agent to flow only in the designated direction of flow (towards the extinguishing zone). It is installed in the inlets of the manifold (multi-container system) and prevents extinguishing agent originating from other extinguishing agent cylinders to exit the manifold into the open when the system is activated or extinguishing agent cylinders have been removed.

Discharge nozzle
Last component in the pipe system of a fire suppression system from which extinguishing agent flows into the extinguishing zone. The orifice cross section of the discharge nozzle opening(s) has an overall or partial effect (depending on the extinguishing agent) on essential parameters including flooding time and extinguishing agent distribution.

Enclosure temperature
The usually prevalent temperature in the protected room. The calculation of the extinguishing agent quantity must be made based on the enclosure temperature that is to be expected.

Extinguishing zone
Total of all areas that will be flooded with extinguishing agent simultaneously in the event of fire.

Flooding
Outflow of the extinguishing agent into the extinguishing zone.

Flooding time
Period during which the required quantity of extinguishing agent flows out.

GWP (Global Warming Potential)
The potential of a substance, measured in CO₂ equivalents, to contribute to global warming (global warming potential). HFC-227ea has a GWP of 3500 (33 years).

Hold time
Period during which a concentration of the extinguishing agent is present inside the extinguishing zone which is higher than the specified minimum concentration.
Glossary

Manifold
Manifolds connect several extinguishing agent cylinders with one another and merge them into a single unit. Each manifold is fitted with a check valve.

Operating pressure
Pressure inside a container at the maximum permitted operating temperature.

Pilot cylinder
Compressed gas cylinder, the contents of which are used for control purposes.

Pre-discharge timer
Period between the time when the alarm signal is issued as a warning to evacuate persons and the release of the extinguishing agent.

Pressure relief device
Preventing damage to the containment components caused by excessive overpressures (required for extinguishing gases as they must be introduced at high concentrations and rates) requires a mechanical pressure relief device which will limit the increase or drop of pressure inside the extinguishing zone to a specified value.

Protected enclosure
Total of all extinguishing zones connected to a fire suppression system.

Release
Automatic or manual activation of the fire suppression system for the purpose of flooding the extinguishing zone by opening the container valves and – if present – the selector valves.

Release device
Device integrated into the container valve or screwed on to the container valve. It opens the cylinder valve to allow the extinguishing agent to flow out. There are the following different types of release devices:

Manual release device: It can/may only be fitted on top of the "Master" extinguishing agent container and, if applicable, also on top of an electrical release device already mounted on the container.

Electrical release device: It is used to electrically release the container. The electrical release device receives its triggering signal from the fire extinguishing detection system.
**Glossary**

**Pneumatic release device**: It is used to pneumatically release additional containers in multi-container systems. It is screwed onto the extinguishing agent container instead of the electric release device and connected to a pneumatic pilot line that is located at the side release outlet of the electrically activated "master" extinguishing agent container.

**Pneumatic/manual release device**: The pneumatic/manual release device also makes it possible to release a container manually on location.

for full text of abbreviations: see SECTION 16

The most important adverse physicochemical, human health and environmental effects
Contains gas under pressure; may explode if heated.

Additional information
This mixture does not contain any substances that are assessed to be a PBT or a vPvB.
EIGA-0783: Contains fluorinated greenhouse gases covered by the Kyoto protocol.
EIGA-As: Asphyxiant in high concentrations.

2.2 Label elements

Labelling according to Regulation (EC) No 1272/2008 (CLP)

**Signal word** warning

**Pictograms**

GHS04

**Hazard statements**

H280 Contains gas under pressure; may explode if heated.

**Precautionary statements**

P410+P403 Protect from sunlight. Store in a well-ventilated place.

2.3 Other hazards

There is no additional information.

Results of PBT and vPvB assessment

This mixture does not contain any substances that are assessed to be a PBT or a vPvB.
VSH200

SECTION 4: First aid measures

4.1 Description of first aid measures

General notes
Take off immediately all contaminated clothing.
In all cases of doubt, or when symptoms persist, seek medical advice.

Following inhalation
Provide fresh air.
If breathing is irregular or stopped, immediately seek medical assistance and start first aid actions. Mouth to mouth resuscitation should be avoided. Use alternative methods, preferably with oxygen or compressed air driven apparatus.

Following skin contact
Thaw frosted parts with lukewarm water. Do not rub affected area.

Following eye contact
Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.

Following ingestion
Get medical advice/attention if you feel unwell.
4.2 Most important symptoms and effects, both acute and delayed
Cardiac arrhythmias.

4.3 Indication of any immediate medical attention and special treatment needed
none

SECTION 5: Firefighting measures

5.1 Extinguishing media
Suitable extinguishing media
co-ordinate firefighting measures to the fire surroundings
Unsuitable extinguishing media
water jet

5.2 Special hazards arising from the substance or mixture
Hazardous decomposition products: Section 10.
Contact with the product can cause burns and/or frostbite.
Contains gas under pressure; may explode if heated.

5.3 Advice for firefighters
In case of fire and/or explosion do not breathe fumes.
Co-ordinate firefighting measures to the fire surroundings.
Do not allow firefighting water to enter drains or water courses.
Collect contaminated firefighting water separately.
Fight fire with normal precautions from a reasonable distance.

Special protective equipment for firefighters
self-contained breathing apparatus (EN 133)

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures
For non-emergency personnel
Remove persons to safety.
Ventilate affected area.
Wearing of suitable protective equipment (including personal protective equipment referred to under Section 8 of the safety data sheet) to prevent any contamination of skin, eyes and personal clothing.
For emergency responders
Wear breathing apparatus if exposed to vapours/dust/spray/gases.

6.2 Environmental precautions
Keep away from drains, surface and ground water.
Retain contaminated washing water and dispose it.

6.3 Methods and material for containment and cleaning up
Advises on how to clean up a spill
Not relevant.
Other information relating to spills and releases
Place in appropriate containers for disposal.
Ventilate affected area.

6.4 Reference to other sections
Hazardous combustion products: see section 5.
Personal protective equipment: see section 8.
Incompatible materials: see section 10.
Disposal considerations: see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling
Measures to prevent fire as well as aerosol and dust generation
Use local and general ventilation.
Prevent from heating up above 50 °C/122 °F.
Pressurized container: may burst if heated.
Specific notes/details
None.
Measures to protect the environment
Avoid release to the environment.
Advice on general occupational hygiene
Do not to eat, drink and smoke in work areas.

7.2 Conditions for safe storage, including any incompatibilities
Flammability hazards
Protect from sunlight.
Incompatible substances or mixtures
Incompatible materials: see section 10.
Protect against external exposure, such as heat.

Consideration of other advice
Keep away from food, drink and animal feedingstuffs.

Ventilation requirements
Provision of sufficient ventilation.

Packaging compatibilities
Only packagings which are approved (e.g. acc. to ADR) may be used.

7.3 Specific end use(s)
No information available.

SECTION 8: Exposure controls/personal protection

8.1 Control parameters
No data available.

8.2 Exposure controls
Appropriate engineering controls
General ventilation.
VSH200

**Individual protection measures (personal protective equipment)**

**Eye/face protection**
Use protective eyewear to guard against splash of liquids.

**Hand protection**
Wear cold insulating gloves/face shield/eye protection.

**Respiratory protection**
In case of inadequate ventilation wear respiratory protection.
Self-contained breathing apparatus (EN 133).

**Environmental exposure controls**
Use appropriate container to avoid environmental contamination. Keep away from drains, surface and ground water.

### SECTION 9: Physical and chemical properties

#### 9.1 Information on basic physical and chemical properties

**Appearance**
- **Physical state**: liquid
- **Form**: pressurized
- **Colour**: colourless
- **Odour**: like ether
- **Odour threshold**: these information are not available

**Other safety parameters**
- **pH (value)**: not relevant
- **Melting point/freezing point**: -129.5 °C
- **Initial boiling point and boiling range**: -18 - -16 °C
- **Flash point**: these information are not available
- **Evaporation rate**: these information are not available
- **Flammability (solid, gas)**: non-flammable

**Explosive limits**
- **Lower explosion limit (LEL)**: these information are not available
- **Upper explosion limit (UEL)**: these information are not available
- **Vapour pressure**: these information are not available
- **Density**: 1.4 - 1.5 g/cm³ at 25 °C
- **Vapour density**: these information are not available
- **Relative density**: these information are not available
**Solubility(ies)**

**Water solubility**
- 0.23 g/l at 25 °C, not miscible in any proportion

**Partition coefficient**
- n-octanol/water (log KOW) 2.289
- Auto-ignition temperature 532 °C
- Decomposition temperature these information are not available

**Viscosity**
- Kinematic viscosity these information are not available
- Dynamic viscosity these information are not available
- Explosive properties not explosive
- Oxidising properties shall not be classified as oxidising

---

**SECTION 10: Stability and reactivity**

**Reactivity**
- Gas under pressure.
- If heated: danger of explosion, gas under pressure, danger of bursting container

**Chemical stability**
- See below "Conditions to avoid".

**Possibility of hazardous reactions**
- No known hazardous reactions.

**Conditions to avoid**
- Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
- Contains gas under pressure; may explode if heated.

**Incompatible materials**
- There is no additional information.

**Hazardous decomposition products**
- Carbon monoxide (CO).
- Carbon dioxide (CO2).
- Hydrogen fluoride (HF).
SECTION 11: Toxicological information

11.1 Information on toxicological effects

Test data are not available for the complete mixture.

Classification procedure

The method for classification of the mixture is based on ingredients of the mixture (additivity formula).

Classification according to GHS (1272/2008/EC, CLP)

Asphyxiant gas, may displace oxygen and cause rapid suffocation. Choking and suffocation risks.

Acute toxicity

Shall not be classified as acutely toxic.

Skin corrosion/irritation

Shall not be classified as corrosive/irritant to skin.

Serious eye damage/eye irritation

Shall not be classified as seriously damaging to the eye or eye irritant.

Respiratory or skin sensitisation

Shall not be classified as a respiratory or skin sensitizer.

Germ cell mutagenicity

Shall not be classified as germ cell mutagenic.

Carcinogenicity

Shall not be classified as carcinogenic.

Reproductive toxicity

Shall not be classified as a reproductive toxicant.

Specific target organ toxicity - single exposure

Shall not be classified as a specific target organ toxicant (single exposure).

Specific target organ toxicity - repeated exposure

Shall not be classified as a specific target organ toxicant (repeated exposure).

Aspiration hazard

Shall not be classified as presenting an aspiration hazard.
SECTION 12: Ecological information

12.1 Toxicity

Aquatic toxicity (acute)
Test data are not available for the complete mixture.

Aquatic toxicity (acute) of components of the mixture

<table>
<thead>
<tr>
<th>Name of substance</th>
<th>CAS No</th>
<th>Endpoint</th>
<th>Value</th>
<th>Species</th>
<th>Exposure time</th>

12.4 Mobility in soil

Data are not available.

12.5 Results of PBT and vPvB assessment

This mixture does not contain any substances that are assessed to be a PBT or a vPvB.
VSH200

12.6 Other adverse effects
Global warming potential 3,500
Endocrine disrupting potential
None of the ingredients are listed.
Remarks
Water hazard class - WHC (Wassergefährdungsklasse): 1 (Slightly hazardous to water)

SECTION 13: Disposal considerations

13.1 Waste treatment methods
This material and its container must be disposed of as hazardous waste.
Dispose of contents/container to an authorized waste treatment facility.
Sewage disposal-relevant information
Do not empty into drains.
Waste treatment of containers/packagings
It is a dangerous waste; only packagings which are approved (e.g. acc. to ADR) may be used.
Handle contaminated packages in the same way as the substance itself.
Remarks
Please consider the relevant national or regional provisions.

SECTION 14: Transport information

14.1 UN number 1058
14.2 UN proper shipping name LIQUEFIED GASES
14.3 Transport hazard class(es)
Class 2.2
Subsidiary risk(s) 2.2 (gas under pressure)
14.4 Packing group not assigned to a packing group
14.5 Environmental hazards non-environmentally hazardous acc. to the dangerous goods regulations
14.6 Special precautions for user
There is no additional information.
14.7 Transport in bulk according to Annex II of MARPOL and the IBC Code
The cargo is not intended to be carried in bulk.
14.8 **Information for each of the UN Model Regulations**

**Transport of dangerous goods by road, rail and inland waterway (ADR/RID/ADN)**

- **UN number**: 1058
- **Proper shipping name**: UN1058, LIQUEFIED GASES, 2.2, (C/E)
- **Class**: 2
- **Classification code**: 2A
- **Danger label(s)**: 2.2

- **Special provisions (SP)**: 662
- **Excepted quantities (EQ)**: E1
- **Limited quantities (LQ)**: 120 ml
- **Transport category (TC)**: 3
- **Tunnel restriction code (TRC)**: C/E
- **Hazard identification No**: 20
- **Emergency Action Code**: 2TE

**International Maritime Dangerous Goods Code (IMDG)**

- **UN number**: 1058
- **Proper shipping name**: UN1058, LIQUEFIED GASES, 2.2
- **Class**: 2.2
- **Danger label(s)**: 2.2

- **Special provisions (SP)**: -
- **Excepted quantities (EQ)**: E1
- **Limited quantities (LQ)**: 120 ml
- **EmS**: F-C, S-V
- **Stowage category**: A
VSH200

International Civil Aviation Organization (ICAO-IATA/DGR)
UN number 1058
Proper shipping name UN1058, Liquefied gases, 2.2
Class 2.2
Danger label(s) 2.2

SECTION 15: Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the substance or mixture

Relevant provisions of the European Union (EU)

Restrictions according to REACH, Annex XVII
none of the ingredients are listed

List of substances subject to authorisation (REACH, Annex XIV)
none of the ingredients are listed

Directive 2011/65/EU on the restriction of the use of certain hazardous substances in electrical and electronic equipment (RoHS) - Annex II
none of the ingredients are listed

Regulation 166/2006/EC concerning the establishment of a European Pollutant Release and Transfer Register (PRTR)
none of the ingredients are listed

Directive 2000/60/EC establishing a framework for Community action in the field of water policy (WFD)
none of the ingredients are listed

Explosives precursors which are subject to restrictions
none of the ingredients are listed
