1. DESCRIPTION
Viking Oxeo Fire Extinguishing Systems utilize pilot hoses to connect the valve of the master extinguishing agent cylinder and the pneumatic release devices of other extinguishing agent cylinders; two (2) pneumatically actuated release devices; or the pneumatic release device (PAE) and the pneumatic pilot pipes of multi-zone systems. An adapter kit is needed to connect the pilot hose to the cylinders.

2. LISTINGS AND APPROVALS
- cULus Listed - EX5248 (Oxeo PR CF)
- FM Approved: Oxeo PR CF

*Listed as a component of a OXEO PR Clean Agent Fire Extinguishing System

3. TECHNICAL DATA
Specifications
- Operating Medium: Argon (IG-01) and Nitrogen (IG-100)
- Nominal Diameter: 1/16” (DN4)
- Operating Temperature Range: -4 ºF to 131 ºF (-20 ºC to 55 ºC)
- Minimum Bend Radius: 2” (51 mm)
- Working Pressure: 5,439 psi (375 bar)
- Test Pressure: 8,166 psi (563 bar)
- Burst Pressure: 16,317 psi (1,125 bar)
- Ferrule: AOL Conical Nipple 24° with O-ring (DKOL)

Material Standards
- Rubber hydraulic hose with galvanized steel ends
- M12x1.5 Union (2)

Ordering Information: Refer to Table 1.

*Interchangeable with part numbers 911008, 911024 and 911025 (Not for VdS / CE/ CNBOP)
4. MAINTENANCE
Always check pilot hoses during routine maintenance for any residue and clean, if necessary. Only use clean pilot hoses in the system. Contaminated pilot hoses can cause the system to malfunction. This can cause severe injuries and significant material and system damage.

Due to deterioration of the material, the hose must be replaced by a new one at the latest after 10 years. See marking “date of manufacture” (month/year) on the hose.

1. Check the hose visually for external damage, corrosion at the armatures, cracks in the plastic coating and fouling.
2. Remove fouling with a damp cloth.
   - Cleaning agents that attack plastics, rubber, or metals must not be used under any circumstances.
3. In case of damage, corrosion or cracks replace the hose immediately.
   - A repair is NOT recommended.
4. Check that the hexagonal cap nuts are tight and retighten by means of a suitable tool or spanner if necessary.
5. Check that the bending radius of the hose is greater than the minimum bending radius.
6. Check that the hose is fitted without torsion.

If the hose must be replaced, follow the steps below for disassembly:
1. Loosen one of the hexagonal cap nuts slightly by means of a suitable tool or spanner (turn counterclockwise).
   - If a hissing sound can be heard there is residual pressure in the hose.
2. Wait until the hose is depressurized.
3. Loosen the hexagonal cap nut completely and also the second hexagonal cap nut by means of a suitable tool or spanner (turn counterclockwise).
