

Special Hazards | FM Approved IBC Fire Protection Containment Unit

Viking's FM Approved fire protection containment unit is used to store single Intermediate Bulk Containers (IBCs) that contain ignitable liquids when located within manufacturing, industrial or other similar type environments. The unit is designed to house composite IBCs that could be located in a production area or a staging area.

The IBC containment unit is intended to capture an ignitable liquid release from a composite IBC. The unit contains the fuel spill allowing the liquid or burning liquid to drop through a flame arrestor and deposit into a holding tank. The holding tank has a capacity of 150% of the composite IBC that it is designed for. The IBC containment unit is offered with sides up or sides down, offering two convenient options for installation. In addition to its installation benefits, the IBC containment units also offer:

- Capacity for full IBC content plus sprinkler system discharge.
- A flame arrestor that protects the containment sump from fire.
- No overflow to protect from the spread of ignitable, burning liquid.
- A convenient folding access door for forklifts and pallet trucks.
- Filling and dispensing access.
- A design meant to facilitate the removal of spill liquid in containment tank.
- Both the Model 275 and the Model 330 have a footprint of 57.5" x 70.5", and are 92" and 98" tall when fully assembled, respectively.
